mine location's overburden density.

Applied Fiber delivered and installed these fibre main boom pendants between the end of May and early June of this year.

One additional benefit of the fibre pendants versus the wire pendants was how easy they were to handle and install.

The foreman of TIC, the general

contractor commissioned to re-assemble the 8200 Marion dragline, says: "These fibre pendants are so much easier to install versus wire – you don't have to fight the weight or torque when pinning – they just went right in."

Cloud Peak is extremely satisfied with the final delivered product and value propositions and is moving forward on the next order of fibre main pendants on another dragline.▼
